This article describes what a smart building is, and illustrates the typical challenges with the management of their related infrastructure. Following this, it outlines how a suitable software solution can help you overcome these challenges.

A [smart building](#) is a structure with automated and centralized control of the building's operations such as heating, ventilation, lighting, air conditioning, humidity, security, and work space control. These operations are optimized for the occupants' comfort and safety, while energy and maintenance costs are minimized.

How to successfully manage a smart building?

Supplementing the BMS with a cable and asset management software solution

- **Integration capabilities:** to achieve the benefits of the systems working together, the solution should offer extensive bi-directional API (Application Programming Interface) capabilities.

- Detailed end-to-end physical layer connectivity and asset tracking: to be able to troubleshoot the connectivity and assets that constitute the smart building, the solution should offer detailed modeling, visualization and reporting capabilities. These capabilities should be applicable to not only the BMS components, but also the network switches and patch panels in the equipment rooms.
- Operational change management: to be able to control change and auditing processes, the solution should offer comprehensive change management capabilities across all components of the smart building infrastructure.

PATCH MANAGER as the best cable and asset management solution to supplement your BMS.

PATCH MANAGER is a powerful software solution to manage your smart building infrastructure. Its flexibility and extensive template library allow you to model and manage smart building assets and connectivity in a realistic, accurate, and detailed manner. User-defined data fields enable you to store custom information against any asset. With PATCH MANAGER, not only do you have detailed insight into your smart devices' whereabouts, you can also easily and quickly report on anything you need to know about your smart building's assets and connectivity. PATCH MANAGER provides a comprehensive Work Order system for managing your 'Moves', 'Adds' and 'Changes', with a wide array of features to seamlessly coordinate work across teams and projects. PATCH MANAGER offers a mature and extensive REST API for integration with your BMS.
